

Hyaluronic acid gels: Combinations for better results

Hyaluronic acid (HA) is widely used in health and beauty applications. New research indicates some promising new findings for HA gels in topical anti-ageing cosmetics. HA is a well-established ingredient in various cosmetic products and offers numerous benefits.

It controls the proliferation of skin cells via the CD44 receptor and has some anti-inflammatory effects on the skin¹. In addition, it influences the growth of keratinocytes, which protect the epidermis from ageing and, thanks to the double bond structure of its D-glucuronic acid moiety², it also has antioxidant properties.
